RESEARCH TOPICS/INTERESTS

My post-doctoral position is focused on climate and health issue, seasonal predictions over Sahel, climate change Impacts on vector-borne diseases like malaria and climate change adaptation in general.

The main aim of my research is to understand at a more fundamental level the climate drivers of the vector-borne diseases such as malaria.

My study is applied in experimental malaria predictions in the framework of the NOAA's Climate Prediction Center, with access to global climate observations and model data, and expertise in the monitoring and forecasting of the global climate system, which provides access to operational real time climate information that can enable decision making in various socio-economic sectors including public health.
